## The Amfit Contact Digitiser and CAD-CAM Orthotic Carving Mill

Foot scan and custom-fitting orthotic for almost every condition.

The Amfit Digitiser gives the ability to create perfect-fitting foot orthotics. The computer controlled Contact Digitiser uses electronic scanning or digitising to create a digital record of the plantar surface of the foot. Modifications are made to the digital record using Amfit's Correct and Confirm Software which offers near limitless design possibilities for perfect-fitting bespoke orthotics.

The digitiser features include:

- Automatically offloads pressure points
- Laser line for perfect alignment
- Supports foot while measuring

The complete design is transferred to the precision CAD-CAM Carving Mill which then mills out the conforming orthotic. A range of densities and top covers to suit individual requirements are available. The entire procedure from scan to fitted orthotic takes about an hour.
